ALIGNMENTS

Cucumber raffinose synthase residues 756 to 769.

06-JUL-1998 (first entry)

AAW53569;

AAW53569 standard; peptide; 14

Ą

```
The present sequence is a cucumber raffinose synthase fragment.
                                      Raffinose synthase gene - useful for preparation transformed plant % \left( 1\right) =\left\{ 1\right\} 
                                                                                                         26-JUL-1996;

The raffinose synthase gene can be used for expression in a plant for the production of raffinose. The raffinose synthase can give raffinose from sucrose and galactinol efficiently. The present sequence represents a raffinose contraction of the contra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Raffinose synthase forms raffinose from sucrose and galactinol, has an optimum pH of 6 to 8 and working temperature of 35 to 40 degrees C, has a molecular weight of 75 to 95 kDa by gel filtration or 90 to 100 kDa by PAGE and SDS-PAGE under reductive conditions and is inhibited by iodoacetamide, N-ethylmaleimide and myoinositol.

                                                                                                                             The present invention relates to a mutant protein of raffinose synthase in which at least one aromatic amino acid present at the position of about 1-7 amino acids from the N-terminus is deleted or replaced. The mutant protein can be used for reducing the raffinose oligosaccharide content in a plant body. The present protein from soybean, was used in the present in a plant body.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of forming raffinose from sucrose and galactinol. The raffinose synthase gene can be used for expression in a plant for the production of raffinose. The raffinose synthase can give raffinose from sucrose and galactinol efficiently. The present sequence represents raffinose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 2;

The raffinose synthetase is capable of producing raffinose by combining a D-galactosyl group through an alpha (1-6) bond with a hydroxyl group attached to the carbon atom at position 6 of a D-glucose residue in a sucrose molecule. The DNA can be used to modify metabolism of a host organism by introducing into the host organism or its cell so that the content of the raffinose family oligosaccharides are useful as food additives with beneficial effects on the gastrointestinal flora.

The sequence is isolated from plant material. The protein forms raffinose by complexing alpha(1 to 6)- D-galactosyl hydroxyl group of the 6C of D-glucose residue in sucrose molecules.

C P. acnes. The disorders include SAPHO syndrome (synovitis, acne,
pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

C P. acnes is also involved in infections of bone, joints and the central
nervous system, however it is particularly involved in the inflammatory

C lesions associated with acnes in a patient comprises contacting a

Sample with a binding agent that binds to the proteins of the invention

and determining the amount of bound protein in the sample. The

C polypeptides may be used as antigens in the production of antibodies

specific for P. acnes proteins. These antibodies can be used to

C downregulate expression and activity of P. acnes polypeptides and

C therefore treat P. acnes infections. The antibodies may also be used as

C diagnostic agents for determining P. acnes presence, for example, by

C enzyme linked immunosorbent assay (ELISA).

C specification, but was obtained in electronic format directly from WIPO

c at fet with a bind activity of patent of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic CC polypeptides. The proteins and their associated DNA sequences are used in CC the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, CC pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. CC P. acnes is also involved in infections of bone, joints and the central cc nervous system, however it is particularly involved in the inflammatory CC lesions associated with acne vulgaris. A method for detecting the CC presence or absence of P. acnes in a patient comprises contacting a CC sample with a binding agent that binds to the proteins of the invention cand determining the amount of bound protein in the sample. The CC polypeptides may be used as antigens in the production of antibodies copypeptides may be used as antigens in the production of antibodies copypeptides may be used as antigens in the production of antibodies consequiate expression and activity of P. acnes polypeptides and CC diagnostic agents for determining P. acnes proteins may also be used as CC diagnostic agents for determining P. acnes proteins may also be used as CC diagnostic agents for this patent did not form part of the printed CC specification, but was obtained in electronic format directly from WIPO can the printed contents of the printed contents in the protein directly from WIPO can the province of the printed contents of the printed can be disconting the province of the printed contents of the printed contents of the printed can be disconting the printed can be disconting the printed contents of the printed contents of the printed can be disconting the printed can be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents rapessed raffinose synthase, a protein that can bind a D-galactosyl group through an alpha(1-6) bond to the hydroxy group attached to the carbon atom at the 6-position of the D-glucose residue in a sucrose molecule to form raffinose. cDNA (see AAZ20210) encoding the enzyme was isolated from rapessed cv. Westar leaf cDNA by PCR. Probes or primers generated from plant raffinose synthase genes (see AAZ20207-10) may be used to obtain other raffinose synthase genes by labeled detection or amplification (claimed). These genes may be used to control the levels of raffinose produced in plants. Antisense genes can be used to knock out existing gene activity, and sense genes to increase the level of gene activity. The resulting transgenic plants may be used as a food source to alter the growing conditions for gut enterobacteria, corroviding general health advantages.
                                                                                                                                                                                                                                                                                                                                                                                 Query Match

"Molecular biology of carbon-phosphorus bond cleavage. Cloning a sequencing of the phn (psil) genes involved in alkylphosphonate uptake and C-P Lyase activity in Escherichia coli B.";

J. Biol. Chem. 265:461-4471(1990).

J. FUNCTION: BELONGS TO AN OPERON INVOLVED IN ALKYLPHOSPHONATE UPTAKE AND C-P LYASE. EXACT FUNCTION NOT KNOWN.

-!- MISCELLANEOUS: THE SEQUENCE SHOWN IS THAT OF STRAIN K12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE-91193228; PubMed-1840580; Makino K., Kim S.K., Shinagawa H., Amemura M., Nakata Makino K., Kim S.K., Shinagawa H., Amemura M., Nakata Makino K., Kim S.K., Shinagawa H., Amemura M., Nakata Makino K., Shinagawa H., Shinagawa H
